# Online Store API -Technical Design

## 1. Overview

The project involves building and testing APIs for three modules: **Products**, **Cart**, and **User**. The APIs support CRUD operations, filtering, sorting, and specific use cases like login, user-specific data, and date-based queries. The design covers both functional requirements and user story-based scenarios.

---

## 2. Modules and Functionalities

### 2.1 Products Module

- **API Endpoints:**
    - GET /products: Retrieve all products.
    - GET /products/{id}: Retrieve a product by ID.
    - GET /products?limit=x: Retrieve a limited number of products.
    - GET /products?sort=asc|desc: Retrieve products in a specific order.
    - GET /products/categories: Retrieve all product categories.
    - GET /products/category/{category}: Retrieve products by category.
    - POST /products: Add a new product.
    - PUT /products/{id}: Update an existing product.
    - PATCH /products/{id}: Partially update a product.
    - DELETE /products/{id}: Delete a product.
- **Data Model:**

```
{
  "id": 1,
  "title": "Product Name",
  "price": 100.0,
  "description": "Product Description",
  "category": "Electronics",
  "image": "url-to-image",
  "rating": {
    "rate": 4.5,
    "count": 120
  }
}
```

- **Functional Requirements:**
    - Support CRUD operations.
    - Enable filtering by category, sorting, and limiting results.

- Handle edge cases like invalid IDs, empty categories, or malformed requests.

---

**2.2 Cart Module**

- **API Endpoints:**
  - GET /carts: Retrieve all cart items.
  - GET /carts/{id}: Retrieve a cart by ID.
  - GET /carts?limit=x: Retrieve a limited number of carts.
  - GET /carts?sort=asc|desc: Retrieve carts in a specific order.
  - GET /carts?startDate=YYYY-MM-DD&endDate=YYYY-MM-DD: Retrieve carts in a date range.
  - GET /carts/user/{userId}: Retrieve carts by user ID.
  - POST /carts: Add a new cart.
  - PUT /carts/{id}: Update a cart.
  - PATCH /carts/{id}: Partially update a cart.
  - DELETE /carts/{id}: Delete a cart.
- **Data Model:**

```
{
  "id": 1,
  "userId": 2,
  "date": "2023-01-01",
  "products": [
    {
      "productId": 1,
      "quantity": 2
    },
    {
      "productId": 2,
      "quantity": 1
    }
  ]
}
```

- **Functional Requirements:**
  - Support CRUD operations.
  - Filter carts by date range or user ID.
  - Enable sorting and limiting of results.
  - Handle invalid product or user IDs gracefully.

---

### 2.3 User Module

- **API Endpoints:**
    - POST /auth/login: Log in to generate a token.
    - GET /users/{id}: Retrieve user details by ID.
    - GET /users: Retrieve all users.
    - POST /users: Add a new user.
    - PUT /users/{id}: Update a user.
    - PATCH /users/{id}: Partially update a user.
- **Data Model:**

```
{
  "id": 1,
  "email": "user@example.com",
  "username": "username",
  "password": "hashed_password",
  "name": {
    "firstname": "First",
    "lastname": "Last"
  },
  "address": {
    "city": "City",
    "street": "Street",
    "number": 1,
    "zipcode": "12345",
    "geolocation": {
      "lat": "0.0000",
      "long": "0.0000"
    }
  },
  "phone": "123-456-7890"
}
```

- **Functional Requirements:**
    - Support CRUD operations.
    - Authenticate users and return tokens.
    - Handle edge cases like invalid user IDs or malformed requests.

---

## 3. Testing Design

### 3.1 Test Cases

- **Products Module:**
  - Verify retrieval of all products.
  - Verify retrieval of a product by ID.
  - Verify retrieval of products with a limit.
  - Verify retrieval of products with sorting.
  - Verify CRUD operations for products.
  - Validate error handling for invalid product IDs.
- **Cart Module:**
  - Verify retrieval of all cart items.
  - Verify retrieval of a cart by ID.
  - Verify filtering carts by date range or user ID.
  - Verify CRUD operations for carts.
  - Validate error handling for invalid cart or user IDs.
- **User Module:**
  - Verify user login functionality.
  - Verify retrieval of a user by ID.
  - Verify retrieval of all users.
  - Verify CRUD operations for users.
  - Validate error handling for invalid user credentials or IDs.

### 3.2 Automation Framework

- **Technology Stack:**
  - Programming Language: Python
  - Testing Framework: Pytest
  - HTTP Client: Requests Library
  - Reporting: Allure Reports, Extent Reports
  - Data Source: JSON files for test data
- **Framework Design:**
  - Modular structure with separate classes for each module (Products, Cart, User).
  - Data-driven testing using JSON or Excel files.

- Reusable utility methods for API requests (GET, POST, PUT, PATCH, DELETE).
- Logging and reporting integration.

---

## 4. Non-Functional Requirements

- **Performance:**
  APIs should respond within 200ms for 90% of requests.
- **Scalability:**
  APIs should handle 100 concurrent users without degradation.
- **Security:**
  Implement token-based authentication for protected endpoints.
- **Error Handling:**
  Return meaningful error messages for invalid requests (e.g., 400 Bad Request, 404 Not Found).

---

## 5. Tools and Technologies

- **API Development:** Node.js, Express.js (or similar backend framework)
- **Database:** MySQL or MongoDB (depending on use case)
- **Testing Tools:** Requests Library, Postman, JMeter (for performance testing)
- **Version Control:** Git
- **CI/CD:** Jenkins or GitHub Actions for automated testing and deployment

---

## 6. Deliverables

1. Functional APIs for all endpoints.
2. Automated test cases for all user stories.
3. Documentation covering API specs, test cases, and architecture.
